

## Some of What DOE Needs to Fix

The mission of DOE should be carefully reviewed and updated.

Change the national energy slogan to: “[All of the Sensible](#)”.

Require that all energy policies be genuinely Science-based.

Reduce the reliance on computer models.

Terminate special renewable energy subsidies (e.g. [PTC](#) and [ITC](#)).

End grid rules that give wind and solar preferential treatment.

Cancel the “[Clean Power Plan](#)”.

Eliminate (or fundamentally change) [NREL](#) and [Berkeley Lab](#).

EIA do a much better job providing the cost of [intermittent sources](#).

Constrain FERC’s [unscientific bias](#) towards renewables.

Substantially revise BOEM’s (DOI) [Renewable Energy mandate](#).

See that military has better protections from turbines (in the [NDAA](#)).

Officially oppose all ethanol subsidies and [favoritism](#).

Approve the [Keystone XL pipeline](#) (with appropriate protections).

Go on record to oppose any [Social Cost of Carbon](#) implementation.

– *These are specifically about nuclear:*

Work towards US nuclear plants being able to use [reprocessed fuel](#).

Approve [Yucca Mt](#) as an acceptable repository for used nuclear fuel.

Fast-track [Thorium](#) (LFTR) & [Small Modular](#) reactors as energy sources

(*Note: most of these are consistent with [EO13777](#)*)
